## RESEARCH EXPERIENCE

**Revise, Refine, Polish: Coarse-to-Fine Learning for Abstract Summarization**      Comp@PolyU  
*Supervised by Prof. Wenjie Li, The Hong Kong Polytechnic University*      Sep. 2018 - Feb. 2019

We proposed a coarse-to-fine multi-stage prediction framework for abstract summarization, composed of multiple decoders each of which operates on the output of the previous stage, producing increasingly refined summaries. Our proposed learning approach addresses the difficulty of vanishing gradients during training by providing a learning objective function that enforces intermediate supervisions. Particularly, we optimize our model with a reinforcement learning approach which utilizes the output of each intermediate decoder's test-time inference algorithm as well as the output of its preceding decoder to normalize the rewards, which simultaneously solves the well-known exposure bias problem and the loss-evaluation mismatch problem.

**Generative Adversarial Network for Abstractive Text Summarization**      SIAT@CAS  
*Supervised by Prof. Min Yang, Chinese Academy of Sciences*      Mar. 2018 - Sep. 2018

We proposed an adversarial process for abstractive text summarization, in which we simultaneously train a generative model G (as an agent of reinforcement learning, which takes the raw text as input and predicts the abstractive summarization) and a discriminative model D which attempts to distinguish the generated summary from the ground truth summary.

The paper has been submitted to ACM Transactions on Intelligent Systems and Technology.

**Cross-dataset Person Re-Identification Using Similarity Preserved Generative Adversarial Networks.**

Intelligent Information  
Fusion Lab@SCUT

*Supervised by Prof. Jianming Lv, South China University of Technology*

*Sep. 2017 - Jan. 2018*

Due to the expensive cost of data labeling, most of the proposed Re-ID algorithms conduct supervised learning on small labeled datasets. Directly deploying these trained models to the real-world large-scale camera networks may lead to a poor performance. We address this cross-dataset Re-ID challenge by transforming the unlabeled images in the target domain to fit the classifier using our proposed similarity preserved generative adversarial networks model.

Comprehensive experiments based on real datasets indicate that our model is better than the state-of-the-art cross-dataset unsupervised transfer learning algorithm.

The paper has been accepted by KSEM. Full paper (Acceptance rate of 23%).

**A Convolutional Neural Network For Multi-scale Taxi Trajectory Prediction.**

Intelligent Information  
Fusion Lab@SCUT

*Supervised by Prof. Jianming Lv, South China University of Technology*

*Sep. 2016 - Sep. 2017*

We propose TCONV which models trajectories as two-dimensional images, and adopts multi-layer convolutional neural networks to combine multi-scale trajectory patterns to achieve precise prediction. Furthermore, we integrate multiple local enhancement convolutional fields to explore these important areas deeply for better prediction.

Comprehensive experiments based on real trajectory data show that T-CONV can achieve higher accuracy than the state-of-the-art methods.

The paper has been accepted by BigComp. Full paper.

**Hadoop Based Distributed Mobile Trajectory Retrieval System.**

New Media Lab@SCUT

*Supervised by Prof. Jianming Lv, South China University of Technology*

*May. 2015 - Sep. 2016*

We develop a mobile trajectory retrieval system named TREST, which is based on the distributed Hadoop and HBase systems. TREST makes use of the horizontal expansion mechanism of Hadoop to store overwhelming spatio-temporal trajectories, and supports frequent incremental insertion of data stream. Meanwhile, TREST maps the spatio-temporal features of trajectories into the simple key-value schema of HBase to support fast retrieval.

Experiments on this data set show that TREST can efficiently support both Single-track and All-track retrieval within milliseconds on average.

The paper has been accepted by DSC. Full paper.
